## **Global DNS – Multiple Server DNS Lookup**

By Harshit Peer

**Articles – <https://support.thehp.in/articles>**

# Requirements

## Server Requirements

WordPress

## Other Requirements

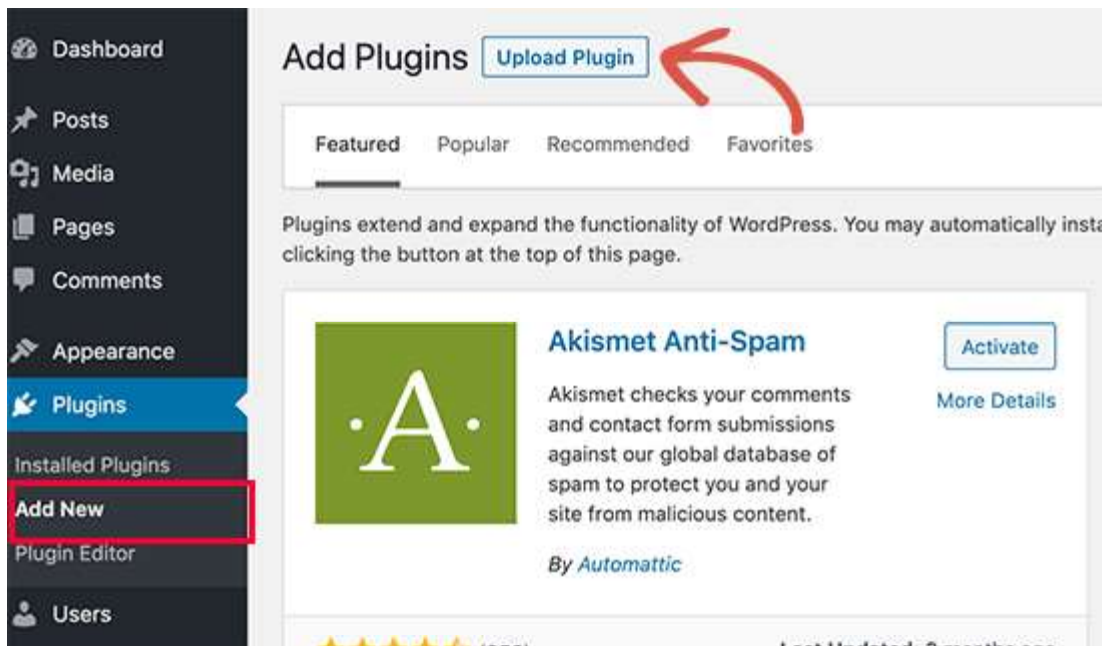

Servers to host DNS Lookup

# Installation

## #1 – Upload Files

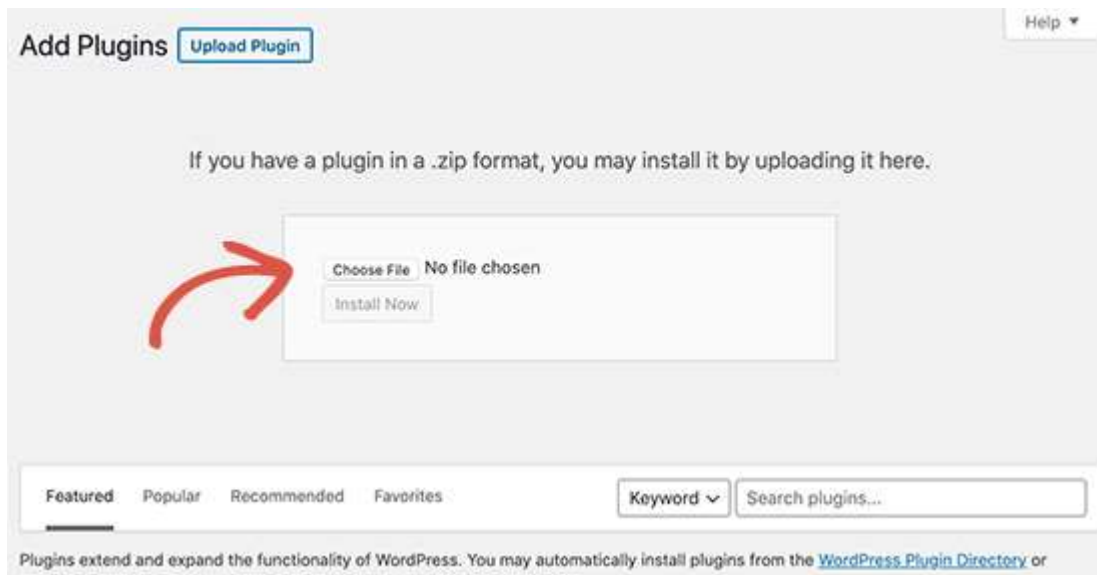

First, you need to download the plugin from the source (which will be a zip file). Next, you need to go to WordPress admin area and visit Plugins » Add New page.

After that, click on the 'Upload Plugin' button on top of the page.

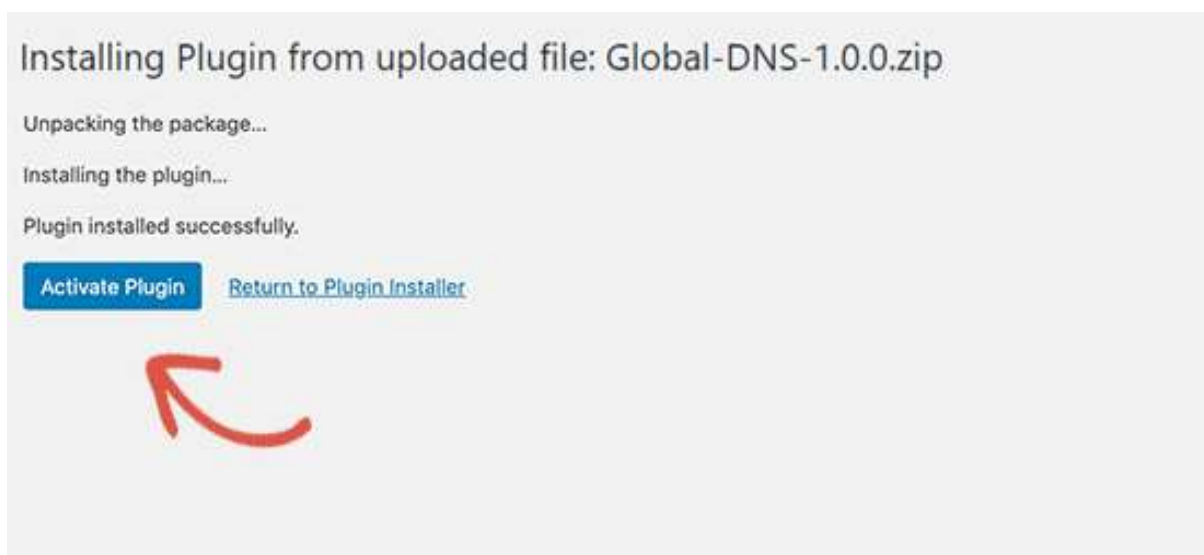

This will reveal the plugin upload form. Here you need to click on the 'Choose File' button and select the plugin file you downloaded earlier to your computer.

Plugin file will be **Global-DNS-X.X.X.zip**

After you have selected the file, you need to click on the 'Install Now' button.

WordPress will now upload the plugin file from your computer and install it for you. You will see a success message like this after the installation is finished.

## #2 – Setup Servers

Here you will need to add servers. To know how to setup server, [visit this article](#).

## #3 – Setup Shortcodes

Based on which WP editor you're using, you need to put following Shortcodes on your page

**[global\_dns\_input]** – This is for collecting the information like domain and type

**[global\_dns\_list]** – This will show the list of servers and will be use to show the result

**[global\_dns\_list]** – This will show the world map and will also be use to show the result

You can find all the Shortcodes in Admin Panel -> Global DNS -> Shortcodes

## Video Tutorial

You can watch a Video Tutorial on how to Install Global DNS using default Gutenberg Editor on WordPress here –
